ACE Digital Language Lab: Strengthening Listening Speaking Reading and Writing Skills One Lesson at a Time

Ask any person who teaches communication skills what the difficult part of their job is and most will say the same thing: getting quiet students to actually talk. It is not because they do not understand the material it's because a classroom full of thirty other students is a scary place to practice speaking out loud. This is the problem that ACE Digital Language Lab Software was created to fix.

The software is based on the LSRW system. Listening Speaking Reading and Writing. Because language skill really divides into these four related abilities. A student can read well and still have trouble when speaking. Someone can write a sentence that's grammatically correct yet have difficulty understanding it when it is spoken quickly. Treating all four as one big group which is how old ways of teaching work leaves holes that appear later during interviews and group conversations.

In the student interface learners go through lessons on their own using their headset without anyone around. They listen to a text record themselves reading or repeating it and then play both versions back to compare. This seems simple. That moment of comparing yourself to the example is where a lot of real improvement takes place. Hearing your own accent next to the example audio is much more helpful than being told to work on your pronunciation in passing.

Writing practice is also done in the interface along with typing exercises that improve both speed and correctness. Reading comprehension games and a built in mean students do not have to switch between five different apps just to find a word or check their vocabulary.

What makes this really helpful for schools than just students is the way it shows teachers what is happening. Every recording every completed task every bit of progress is. Available to the teacher through the system. Of guessing which students need more help trainers can see the information and offer support early on.

Group discussion features add the missing part. Because language is not just about doing individual exercises it is about being able to talk in real conversations. Combining safe practice with organized group activities gives students the best of both methods.

Schools that use this kind of planned LSRW practice usually see results in placement interviews after a few semesters. If you want to add this kind of discipline to your language training program get in touch with Biyani Technologies to see the ACE Digital Language Lab, in action.
